Can a photovoltaic/thermal solar collector and a dryer unit improve drying efficiency?

The most important results which can be concluded were as follows: The combination of a Photovoltaic/thermal solar collector with a dryer unit improved the both specific moisture extraction rate, drying efficiency, and energy efficiency by 1.46-2.39, 1.50-2.54, and 1.59-2.65 times compared reference dryer.

Can a hybrid solar air collector improve drying efficiency?

The utilization of a hybrid system of solar air collector with phase change materials and geothermal energy improved the drying efficiency by 20.5% as compared to the case of utilizing only a flat plate solar collector as preheating unit.

What is a solar dryer auxiliary system?

This system is typically used to provide additional heating or ventilation to the drying chamber in situations where solar energy is not sufficient or when the weather conditions are unfavorable. Auxiliary systems for solar dryers include electric heating elements, photovoltaic, and backup heat sources, such as gas, fuel, and biomass.

Do solar air collectors improve drying efficiency?

A hybrid system of solar air collectors with phase change materials and geothermal energy was utilized as preheating units to preheat the air before it was fed to the dryer chamber. The utilization of a proposed hybrid system of solar air collector with phase change materials and geothermal energy improved the drying efficiency by 20.5%.
