

How do flow batteries store energy?

Unlike conventional batteries, which store energy within the electrodes themselves, flow batteries store energy externally in liquid electrolytes held in large tanks. These electrolytes contain dissolved electroactive materials that interact at electrodes housed inside a reactor cell.

What is flow battery technology?

Flow battery technology is an innovative energy storage solution that utilizes electrochemical reactions to store and release energy. Flow batteries consist of two electrolyte solutions that circulate through a cell, allowing for scalable energy capacity and long discharge durations.

How does a flow battery differ from a conventional battery?

In contrast with conventional batteries, flow batteries store energy in the electrolyte solutions. Therefore, the power and energy ratings are independent, the storage capacity being determined by the quantity of electrolyte used and the power rating determined by the active area of the cell stack.

What is a true flow battery?

True flow batteries have all the reactants and products of the electro-active chemicals stored external to the power conversion device. Systems in which all the electro-active materials are dissolved in a liquid electrolyte are called redox (for reduction/oxidation) flow batteries.
