Comparison of power ratings and discharge time for different applications of flywheel energy storage technology.

Flywheel energy storage (FES) works by spinning a rotor (flywheel) and maintaining the energy in the system as rotational energy.

ESSs store intermittent renewable energy to create reliable micro-grids that run continuously and efficiently distribute electricity by balancing the supply and the load [1].

Torus Spin stores energy kinetically, charges 10x faster, boosts power quality, supports black starts, and cuts peak demand costs.

FESS operates by storing energy in the form of rotational kinetic energy, allowing for quick bursts of power delivery over short durations. This characteristic makes flywheels ideal for stabilizing short ...

More than 15 flywheel units have been tested with the fleet accumulating more than 38,000 hours of operating history. Numerous design and manufacturing enhancements emerged from this process. ...
