

How does solar energy work?

To generate solar energy, the photons radiated from the sun to earth must be collected, converted into a usable format and then delivered to an electronic device or the electric grid. Arrays of photovoltaic cells are normally used to collect the energy from the sun and convert it into electricity.

How does solar power turn sunlight into usable energy?

Understanding how solar power turns sunlight into usable energy is fascinating. Solar energy is harnessed through photovoltaic panels that convert sunlight directly into electricity. These panels, made up of solar cells, capture particles of light called photons, which then interact with the cells to generate an electric current.

How is solar energy produced?

Solar energy is produced through a process called nuclear fusion that takes place in the sun. During this process, hydrogen atoms in the sun combine to form helium and in the process, energy is released. This energy travels to the earth in the form of light and heat and can be captured and converted into electricity using photovoltaic solar panels.

How do solar panels collect energy?

Solar panels collect solar energy via solar cells (photovoltaic cells). As the name suggests, "photo" means light and "volic" means electrical energy, thus photovoltaic means electricity made of light energy.
