

In today's 5G era, the energy efficiency (EE) of cellular base stations is crucial for sustainable communication. Recognizing this, Mobile Network Operators are actively prioritizing EE for both ...

The rapid deployment of Fifth-generation base stations (5G BSs) in urban communities has led to rising electricity costs for mobile network operators.

To enhance the utilization of base station energy storage (BSES), this paper proposes a co-regulation method for distribution network (DN) voltage control, enabling BSES participation in ...

First, on the basis of in-depth analysis of the operating characteristics and communication load transmission characteristics of the base station, a 5G base station of virtual power plants ...

We propose transforming base stations into energy-communication-transportation integrated hubs by adding electric vehicle supply equipment (EVSE), which can utilize excess energy ...

This technical report explores how network energy saving technologies that have emerged since the 4G era, such as carrier shutdown, channel shutdown, symbol shutdown etc., can be leveraged to ...

Efficient utilization and intelligent dispatch of ES resources at 5G BSs are crucial for improving energy efficiency, enhancing grid reliability and stability, and facilitating the integration of ...

This paper examines the coupling relationships among heating, cooling, electricity, and gas on both the supply and demand sides, proposing a heterogeneous energy-integrated VPP ...

To achieve low latency, higher throughput, larger capacity, higher reliability, and wider connectivity, 5G base stations (gNodeB) need to be deployed in mmWave. Since mmWave base stations (gNodeB) ...

Vast quantities of 5G base stations, featuring largely dormant battery storage systems and advanced communication technology, represent a high-quality fast frequency regulation resource for ...
