

Compared with traditional EL-PBC method, this paper proposed a reconstructed EL-PBC scheme by properly optimizing the noise term. Then, the equivalent output impedance of the grid ...

A split-phase three-level LCL grid-connected inverter is proposed to match the single-phase three-wire split-phase output power grids in countries such as those in North America.

Due to the control delay in digital control systems, this damping can cause the system to exhibit non-minimum phase behavior within specific frequency ranges. This study proposes a joint active ...

To improve the grid current quality under an ultra-weak grid, a virtual capacitor is introduced. Then repetitive control prediction is adopted to compensate for the lag phase of the ...

This paper presents a current control design for stabilizing an inductive-capacitive-inductive (LCL)-filtered grid-connected inverter (GCI) system under uncertain grid impedance and ...

The control design of this type of inverter may be challenging as several algorithms are required to run the inverter. This reference design uses the C2000 microcontroller (MCU) family of devices to ...

Fig. 1 demonstrates a single-phase LCL-filtered grid-connected voltage source inverter (VSI) system. The configuration comprises five core components: a renewable energy source, an ...

This book focuses on control techniques for LCL-type grid-connected inverters to improve system stability, control performance and suppression ability of grid current harmonics.

In this article, an alternative active damping method is proposed for LCL-filtered grid-connected inverter, which is compared with the existing capacitor current feedback active damping ...
