

What is a user-side microgrid?

User-side microgrid is a type of more flexible, small-scale, diversified and low-carbon power energy supply form near the user side. Distributed photovoltaic power generation, wind power, energy storage devices and some other DERs are usually incorporated in the user-side microgrid. It can operate in both island mode and grid-connected mode .

What makes a microgrid unique?

From our experiences at Mayfield Renewables, we'll stipulate that most microgrids share these four features - all within a defined boundary: Distributed energy resources (DERs): local (on-site) energy storage and generation sources that can function independently from the centralized, bulk power supply infrastructure.

What is a microgrid and how does it work?

A microgrid is a group of interconnected loads and distributed energy resources within clearly defined electrical boundaries that acts as a single controllable entity with respect to the grid.² A microgrid can operate in either grid-connected or in island mode, including entirely off-grid applications. Figure 1 shows one example of a microgrid.

What are the research efforts on user-side microgrid?

Currently, the related research efforts on user-side microgrid mainly falls into the following aspects, namely system control,, system structure development, system optimization,, decision-making and service model innovation of microgrid . TOU pricing is popular price-based DR, .
