

What is a battery management system (BMS)?

The BMS is an electronic system designed to monitor and control the performance of batteries or battery packs. It ensures safe, efficient, and reliable operation of an EV. Its primary functions include performance management, thermal protection, state estimation, fault diagnosis, and communication for data storage and transmission.

What is energy storage system?

Energy storage systems (ESS) An energy storage system (ESS) is a technology that captures and stores energy for later use. The classification of energy storage encompasses several categories.

What is BMS data storage?

For BMS applications, vast datasets containing vital parameters of the battery pack, 14,15 such as real time current, voltage, temperature, and states of each component are generated which require data storage capabilities. These datasets can be stored for analysis and performing computational studies in remote cloud servers.

What is a cloud-based battery management system (BMS)?

As summarised in Table 1, a cloud-based BMS offers several improvements and advantages and opens multiple new horizons to monitor and control battery packs compared to a conventional BMS in different dimensions. Based on the discussions presented in the sections so far, the next section will introduce the perspective IBMS.
