

Modern solar facade solutions offer various integration options, from semi-transparent glass panels ideal for office buildings to opaque cladding systems suitable for industrial facilities.

Given Europe's rapidly changing climate and commitment to improving energy efficiency, it is crucial that buildings are designed or renovated without delay to withstand higher temperatures.

The European Union solar control glass market stands at a critical inflection point, shaped by the powerful convergence of stringent regulatory mandates, escalating energy costs, and a profound architectural ...

This BIPV solution came from participation in EU funded project SmartFlex. The project started in 2012 as joint partnership with several manufacturers and R& D institutes across Europe.

Consequently, the semi-transparent photovoltaic glass improves the energy efficiency and comfort, lowers the operating costs and reduces the carbon footprint of buildings.

With its project in Norway, Swiss solar roofing provider Sunstyle demonstrates how photovoltaics can be adapted to suit sensitive heritage sites. The listed neo-Gothic church in Sarpsborg is now equipped ...

In addition to a standard roof-top system, our particular customized glass-glass modules have been integrated into the facade surface which do not only generate energy but also comply with all legal requirements ...

Use of amorphous silicon photovoltaic glass with a transparency of 20%. Photovoltaic glass modules have been installed as the main building material of the roof. Heliotrope is one of the earliest ...

While existing residential buildings can greatly benefit from adding a solar installation, the directive does not require solar installations on such buildings.

**Uncompromising Durability:** Experience the pinnacle of solar technology with our glass-glass module. The robust construction, featuring 3.2 mm dual glass, ensures exceptional resilience against the harshest ...
