

What is solar inverter sizing?

Solar inverter sizing refers to choosing an inverter with the appropriate AC output for your solar panel system's DC input. It's about matching capacity and performance, without wasting energy or breaching local export limits. Inverter size is measured in kilowatts (kW). It should match your solar array within a 1.15 to 1.33 ratio.

How do I choose a solar inverter?

A quick rule of thumb for choosing inverter size: To get the perfect match, look at your: A system that's too small will clip your solar output. A system that's too large may be restricted by your local grid. 5. Export Limits May Affect Your Choice Some networks limit how much power you're allowed to export:

What is a good ratio for a solar inverter?

A ratio between 1.15 and 1.25 is considered ideal in most residential and commercial systems. This allows for a slight oversizing of the panels compared to the inverter, which increases energy yield without significantly impacting performance due to occasional clipping. Why slightly oversize?

Why is inverter size important?

Inverter size also plays a key role in the DC-to-AC ratio--a critical design metric in any solar system. This ratio compares the total power rating of your solar panels (in DC) to the maximum output of your inverter (in AC).
