

This framework provides relevant background information for State Energy Offices and PUC consideration, regardless of their state's microgrid landscape, through examples from peers as states ...

Following major severe weather events, communities nationwide have expressed new interest in deploying microgrids to harden the power grid around critical loads.

Microgrids often include technologies like solar PV (which outputs DC power) or microturbines (high frequency AC power) that require power electronic interfaces like DC/AC ...

One of these solutions is microgrids that can disconnect from the grid and offer grid resilience during an outage. While this technology is still finding its footing in the industry, states ...

Grid governance has been developed by the Chinese party-state to collect intelligence at the grassroots level for the early pre-emption of what it defines as social instability.

Microgrids that incorporate renewable energy resources can have environmental benefits in terms of reduced greenhouse gas emissions and air pollutants. In some cases, microgrids can sell power ...

Oregon lawmakers have passed two bills that experts say will make communities more resilient as the state's grid faces rising electricity demand, more frequent extreme weather events and...

Microgrids provide less than 0.3 percent of U.S. electricity, but their capacity has grown by almost 11 percent in the past four years. Of the 692 microgrids in the United States, most are ...

a meaningful solution for the operational needs of the state electric grid and the fundamental architecture of the grid supports robust contributions from distributed energy resources and microgrids.

The three-tiered, 300-kW/386-kWh grid-tied system is capable of providing grid stabilization, microgrid support, and on-command power response. The three tiers of batteries are ...
