

The inverter sends single-phase electricity to the grid

What is a single-phase string inverter system?

Single-phase string inverter systems convert the DC power generated by the photovoltaic (PV) panel arrays into the AC power fed into a 120 V / 220 V single-phase grid connection. The power rating typically ranges from 1kW to 10kW and is primarily used in residential market. The system's main components handle the DC-AC conversion.

How does a single phase inverter work?

Single-phase inverters can provide frequency support through droop control, where the active power output is adjusted based on the measured frequency deviation. This capability, known as primary frequency response, helps maintain grid frequency stability during disturbances.

What is an inverter & how does it work?

This allows the clean, renewable energy to be used directly by household appliances. Inverters are also used in Uninterruptible Power Supply (UPS) systems, which rely on internal batteries supplying DC power and instantly converting it to AC when the main power source fails.

How do grid-following inverters work?

Traditional "grid-following" inverters require an outside signal from the electrical grid to determine when the switching will occur in order to produce a sine wave that can be injected into the power grid. In these systems, the power from the grid provides a signal that the inverter tries to match.
