

# The maximum number of base station communication channels supported by 5G

In 5G NR, the base station channel bandwidth can be greater than or equal to the UE channel bandwidth. E.g., a NR base station could support 100MHz channel bandwidth, while a UE could use ...

We commonly talk about downlink (base station to UE) and uplink (UE to base station) channels. However, there are also sidelink channels that enable direct device-to-device ...

Several scenarios require the 5G system to support very high traffic densities of devices. The Massive Internet of Things requirements include the operational aspects that apply to the wide ...

Figure 1 shows the differences among 5G frequency bands in terms of capacity and coverage. Due to the coverage characteristics of the 5G frequency bands, high-bands are suitable for dense urban ...

Learn about the different classes of 5G NR base stations (BS), including Type 1-C, Type 1-H, Type 1-O, and Type 2-O, and their specifications.

Frequency bands for 5G New Radio (5G NR), which is the air interface or radio access technology of the 5G mobile networks, are separated into two different frequency ranges.

While a variety of options are available on the network side, the device must support a maximum number of these. The Smartphone manufacturers Apple and Samsung have a significant influence ...

This information covers the frequency ranges (FR1 and FR2), duplex modes (FDD, TDD, and, if applicable, supplementary uplink or downlink), maximum supported bandwidths, subcarrier spacings, ...

This information covers the frequency ranges (FR1 and FR2), duplex ...

The present document establishes the minimum RF characteristics and minimum performance requirements of NR and NB-IoT operation in NR in-band Base Station (BS).

It defines various channels, including synchronization channels, broadcast channels, and physical channels, that play a key role in the communication between base stations and user ...
